

Dejima, Chinatown & Minamiyamate, Nagasaki

Then-and-now aerial photographs, how the ground was made, and the disasters people chose to remember — compiled automatically from public Japanese government data.

出島・新地・南山手（長崎市）

Study area	2.0 km × 1.3 km around 32.7395° N, 129.8725° E
Oldest aerial photograph	1961–1969
Aerial series in this brief	1961–1969, 1974–1978, 2024
Main natural landform	Mountain and hill slopes (35%)
Former river channels	none mapped
Filled, reclaimed or drained land	16%
Former sea, river or pond	11%
Meiji-era paddies, marsh and flats	none mapped
Disaster memorials within 3 km	3 (flood 3, landslide or debris flow 3)

What this brief is. A reading aid for comparing the same ground across decades. It shows what the photographs and GSI's land surveys record; it does not describe current conditions, access or opening hours.

What it is not. Not a hazard assessment or a property survey. Landform classes describe typical tendencies of the ground; for present-day risk, read the official hazard map of the municipality.

Edition 2026-09-27. Aerial photographs, landform and Meiji-era lowland data: Geospatial Information Authority of Japan (GSI), processed by Japan Time Atlas. Memorial data: GSI Natural Disaster Memorials, summarised and translated by Japan Time Atlas.

The same ground, 1961–1969 and 2024

1961–1969 aerial photograph — GSI Tiles *ort_old10*, cropped and annotated by Japan Time Atlas. North is up; the frame is identical in both images.

2024 annual orthophoto — GSI Tiles *nendophoto2024*, cropped and annotated by Japan Time Atlas. Capture dates within a mosaic can differ from place to place.

How to compare. Anchor on features that rarely move — river banks, rail lines, shrine and temple grounds, main roads — then look for what changed around them. Differences in tone come from film, camera and season, not from the land itself.

The decades in between

Every further GSI series that covers the same frame, oldest first. Each series is a compilation: photographs within one series were taken on different dates, which is why seams and changes of tone can appear inside a frame.

1974-1978 · GSI Tiles *gazo1*, processed

Rivers, shorelines and terraces

Natural landforms as classified by GSI, over a recent aerial photograph in gray. Dark blue outlines mark former river channels.

 Mountain and hill slopes 35%	 Floodplain and coastal plain 19%
 Former water area 11%	 Water 2.5%
 Landslide topography 1.4%	 Plateaus and terraces 0.8%

What the main landforms mean

Mountain and hill slopes (35%). Ridges, valleys and fairly steep ground, including terrace-scarp slopes and volcanic ground. Heavy rain or earthquakes can trigger slope failures, debris flows and landslides.

Floodplain and coastal plain (19%). Low, flat ground of little relief, built from sand and mud left by floods, or former seabed that emerged. River flooding. Ground is softer nearer the coast and shakes somewhat more; liquefaction tendency is strong on coastal plains and somewhat strong on floodplains. Storm surge near the coast.

Former water area (11%). Land shown by old maps and aerial photographs to have been sea, lake, pond, reservoir or river, later turned into land. Soft ground: very strong liquefaction tendency where filled, strong where drained. Storm surge near the coast.

Descriptions translated and condensed from GSI's landform-classification legend. They describe tendencies of each landform type, not the condition of any individual plot.

Fill, reclamation and the fields beneath the town

Hatching: man-made ground as classified by GSI. Teal outlines: former sea, river or pond. Dark blue outlines: former river channels.

GSI “Meiji-era lowland” data, traced from topographic maps of the 1880s–1900s; GSI warns that positions can be off by a considerable distance, especially in the Kanto and Kinki regions. Only low, wet or open ground was traced: towns, dry fields and forest of the period are left blank.

Man-made ground

-  Filled and reclaimed land 16%
-  Cut ground 4.8%

Filled and reclaimed land (16%). Ground raised with fill, land made by dumping soil into the sea, rivers or ponds, or valleys filled in. May flood if not raised enough; on hills, rain or earthquakes can make the fill fail; in lowlands the liquefaction tendency is very strong, especially on filled sea, lake or river beds.

Cut ground (4.8%). Ground made by cutting into slopes of mountains or terrace edges. Depending on the cut slope, heavy rain or earthquakes may bring it down; the ground itself is generally firm.

Meiji-era lowland

-  River, pond or sea 40%

Memorials to natural disasters nearby

Numbered memorials; the black rectangle is the study area of this brief. Frame 7 km across.

Memorial	Disaster	Erected	Distance
1 Memorial tower to the 1982 Nagasaki flood at the site of Shianbashi bridge 長崎大水害記念塔	Heavy rain of July 1982 (Nagasaki flood, 23 Jul 1982) · flood / landslide or debris flow	1984	0.8 km
2 Monument to recovery from the 1982 Nagasaki flood and to friendship with China 水害復興と友好の記念碑	Heavy rain of July 1982 (Nagasaki flood, 23 Jul 1982) · flood / landslide or debris flow	1989	1.1 km
3 Memorial to the victims of the 1982 Nagasaki flood in Narutaki 長崎大水害慰霊碑	Heavy rain of July 1982 (Nagasaki flood, 23 Jul 1982) · flood / landslide or debris flow	2017	2.9 km

What the memorials record

1. **Memorial tower to the 1982 Nagasaki flood at the site of Shianbashi bridge.** In the torrential rain of 23 July 1982 the water here, at the site of Shianbashi bridge, reached 1.57 m, and people, cars and everything else disappeared beneath the muddy flood. Residents rebuilt, and the district regained its liveliness. The tower is topped by a red-seal trading ship sailing towards the future, in praise of that spirit of recovery.
2. **Monument to recovery from the 1982 Nagasaki flood and to friendship with China.** On 23 July 1982 torrential rain left 262 people dead or missing in Nagasaki; of the stone bridges on the Nakashima River, 6 were washed away and 3 half-destroyed. The monument was made in China, which helped build the river's stone bridges; it shows a Chinese boy and a Japanese girl together taming a dragon that brings wind and rain.
3. **Memorial to the victims of the 1982 Nagasaki flood in Narutaki.** Shortly after 5 pm on 23 July 1982 a violent thundery downpour of around 100 mm struck, and a massive debris flow in the Narutaki area left 23 people dead and 1 missing. The memorial honours them and passes on the lesson so that such a disaster is never repeated.

Source: GSI Natural Disaster Memorials (自然災害伝承碑). English names and notes are Japan Time Atlas translations and summaries of GSI's Japanese descriptions; the memorials' own inscriptions may say more. "Erected" is the year GSI records for the monument.

Where every element comes from

- **Aerial photographs** (pp. 2–3) — Geospatial Information Authority of Japan (GSI), GSI Tiles: series *ort_old10* (1961–1969), *gazo1* (1974–1978) and *nendophoto2024*. Cropped, resized and annotated by Japan Time Atlas. List of GSI Tiles: <https://maps.gsi.go.jp/development/ichiran.html>
- **Landform classification** (pp. 4–5) — GSI landform-classification vector tiles (natural and artificial landforms), compiled by GSI from its Land Condition Maps, Flood Control Terrain Classification Maps and vulnerable-landform surveys. Rendered, measured and translated into English by Japan Time Atlas. https://github.com/gsi-cyberjapan/experimental_landformclassification
- **Meiji-era lowland** (p. 5) — GSI “明治期の低湿地” tiles and legend (https://maps.gsi.go.jp/legend/lw_legend.pdf), measured and translated by Japan Time Atlas.
- **Natural disaster memorials** (p. 6) — GSI Natural Disaster Memorials (自然災害伝承碑), registered by municipalities, <https://www.gsi.go.jp/bousaichiri/denshouhi.html>; processed by Japan Time Atlas (selection by distance, English translation and summary). Memorial photographs are not reproduced.

Method

The study area is a fixed rectangle of 2.0 × 1.3 km. Every GSI photo series that covers at least 85% of it is included; the newest annual orthophoto covering at least 90% of it is used as “now”, with any gap filled from GSI's latest seamless mosaic. Landform shares are areas of the rectangle measured on GSI's polygons at zoom level 14, each class merged before measuring. Meiji-era shares count map pixels by legend color. Memorials are selected by straight-line distance from the center of the study area.

Limits

Historical series are mosaics of photographs taken on different dates; GSI publishes the flight date of each photograph. Landform data record conditions at the time of survey. Nothing in this brief shows present-day access, safety or opening hours.

Area Dossier. The same district with a 4–8 page English history, written from Japanese library sources and cited page by page.

Deep Research. A single hamlet or address, researched in libraries and archives.

Compiled by Japan Time Atlas; not produced, reviewed or endorsed by GSI, MLIT or any Japanese government agency. Not an official hazard map and not for statutory real-estate disclosure. Generated 2026-09-27 by an automated pipeline ([research/lab-07/scripts/basic.py](#)).
